R. Homan and mouse cDNA sequences."

R. Howan and mouse cDNA sequences."

The N-terminal is probably involved in protein-protein interaction via coiled-coil formation and may function in anchorage of p62 to the pore complex (B similarity).

C. -- SUBUNIT: Component of the pose complex, a complex at least composed of NUBC. NUB

Not required for the specification of neuronal identity. May regulate transcription by binding to DNA (By similarity).
-!- SUMCELBULATION: Nuclear (By similarity).
-!- SIMILARITY: Belongs to the Prospero homeobox family.

Used to improve some of the physical properties such as firmness, elasticity and moisture retention of food such as meat, poultry and seafcod. SIMILARITY: Belongs to the bacterial TGase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        It has

Lee B.N., Adams T.H.;

"Overexpression of flbA, an early regulator of Aspergillus asexual

sporulation, leads to activation of brlA and premature initiation of

development.";

    development.";
    Mol. Microbiol.
    14:323-334(1994).
    1- FUNCTION: Required for asexual sporulation and normal colony development. May be involved in brlA activation. Could play a regulatory role in controlling the flug-initiated signal transduction pathway that triggers the asexual reproduction.
    1- DEVELOPMENTAL STAGE: Present throughout the asexual cycle.
    1- SIMILARITY: Contains 1 RGS domain.
    1- SIMILARITY: Contains 1 DEP domain.

                                                                                                                                                                                                                                                                                                                                                Bmericella nidulans (Aspergillus nidulans).

Mol. Genet. 9:1443-1452(2000).
--- FUNCTION: Potential regulator of neural basic helix-loop-helix genes (By similarity).
--- SIBCELULIAR LOCATION: Nuclear (Probable).
--- SIMILARITY: Belongs to the BAR homeobox family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Homo sapiens (Human).

SUBUNIT: P1 and P2 exist as dimers at the large ribosomal subunit.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Single-stranded DNA-binding protein, mitochondrial precursor (Mt-SSB)
(MtSSB) (Dm mtSSB) (Low power protein).
                                                                                                                                                                                                                                                                                                                                   Bukaryota; Euglenozoa; Kinetoplastida; Trypanosomatidae; Leishmania.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      -!- PTM: Phosphorylated (By similarity).
-!- SIMILARITY: Belongs to the L12P family of ribosomal proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       -!- FUNCTION: Plays an important role in the elongation step of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Eukaryota; Metazoa; Arthropoda; Hexapoda; Insecta; Pterygota;

"A maize ribosome-inactivating protein is controlled by the
transcriptional activator Opaque-2.";
Plant Cell 4:225-234(1992).
-!-FUNCTION: Possesses features of some constitutive defense agent.
The coordinate Opaque-2-controlled synthesis of this protein and
the major seed storage proteins (Zeins) may provide the
germinating seedling with both nutritional benefits and protection
against pathogen invasion of the surrounding endosperm.
-!- CATALYTIC ACTIVITY: Endohydrolysis of the N-glycosidic bond at one
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      TISSUE SPECIFICITY: Accumulates to high levels in seeds. SIMILARITY: Belongs to the ribosome-inactivating protein family. Type 1 RIP subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Zea mays (Maize).

"Pur-1, a zinc-finger protein which binds to purine-rich sequences, activates an insulin promoter in heterologous cells.";
Proc. Natl. Acad. Sci. U.S.A. 89:11498-11502(1992)
-!- FUNCTION: TRANSCRIPTIONAL ACTIVATOR THAT BINDS, IN VITRO, TO PURINE-RICH GAGA SITES FOUND IN THE PROMOTER OF MANY GENES INCLUDING INSULIN I AND II AND ISLET AWALLOID POLYPEPTIDE.
IN VITRO, ACTIVATES TRANSCRIPTION OF RAT INSULIN I PROMOTER IN BOTH PANCREATIC AND NONPANCREATIC CELLS.

genes. It may down-regulate expression of ASCL1 and, within the thalamus, up-regulate NGN2, thereby regulating distinct patterns of neuronal differentiation.
SUBCELLUIAR LOCATION: Nuclear.
TISSUE SPECIFICITY: Expressed in the ganglion cell layer of the retina in the eye and in the ventral zone of the dorsal thalamus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          PRINTS; PR00024; HOMEOBOX.

"The HBP-1 family of wheat basic/leucine zipper proteins interacts
with overlapping cis-acting hexamer motifs of plant histone genes.";
J. Biol. Chem. 269:994-9985(1994).
-!-FUMCTION: Binds to the hexamer motif 5'-ACGTCA-3' of histone gene
promoters. Also binds to the hexamer motif in the promoter of the
35S RNA of Caulliflower mosaic virus.
-!-SUBUNIT: Binds DNA as a dimer.
-!-SUBCELLUAR LOCATION: Nuclear.
-!-SUBCELLUAR LOCATION: Nuclear.

STRAIN-Kinshu X Showa; TISSUB-Fat body;

Ramimura M., Tomita S., Fujiwara H.;

Submitted (AUG-1995) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: Receptor for ecdysone. Binds to ecdysone response elements (BCRES). May play a role in the implementation of the choriogenic program at the end of vitellogenesis.

-!- SUBNINIT: Heterodimer of ECR and CF1 (Potential).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        01-OCT-1996 (Rel. 34, Created)

J. Exp. Med. 172:589-597(1990).
-!- FUNCTION: Developmentally regulated neuraminidase implicated in parasite invasion of cells. May contribute to the pathology during T.cruzi infection by cleaving sialic acid from cells of the immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Kahn S., van Voorhis W., Eisen H.; "The mammalian form of Trypanosoma "The major 85-kD surface antigen of the mammalian form of Trypanosoma cruzi is encoded by a large heterogeneous family of simultaneously
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           -!- CATALYTIC ACTIVITY: Hydrolysis of alpha-(2->3)-, alpha-(2->6)-, alpha-(2->6)-, alpha-(2->8)-glycosidic linkages of terminal sialic residues in oligoasconarides, glycoproteins, glycolipids, colominic acid and synthetic substrates.
-!- DEVELOPMENTAL STAGE: Mammalian stage of parasite.
-!- MISCELLANBOUS: The parasite mammalian stage surface antigen exhibits extensive antigenic diversity.
-!- SIMILARITY: Benongs to family 33 of glycosyl hydrolases.
-!- SIMILARITY: Contains 2 BNR repeats.
                                                                                                                                                                                                                                                                                                                              Eukaryota; Euglenozoa; Kinetoplastida; Trypanosomatidae; Trypanosoma.

-!-FUNCTION: Transcriptional corepressor that binds to a number of transcription factors. Inhibits NF-kappa-B-regulated gene expression. Inhibits the transcriptional activation mediated by FOXA2, and by CTNNB1 and TCF family members in Wnt signaling. The effects of full-length TLE family members in Wnt signaling. The sassociation with dominant-negative AES.
-!- SUBUNIT: Homoolignmer and heterooligomer with other family members. Binds LEF1, RUXI, PWIX3, FOXA2, UTX, UTY, histone H3, HESX1, HES1 and the NF-kappa-B subunit RELA.
-!- SUBCELLULAR LOCATION: Nuclear and chromatin-associated, depending

                                                                                                         PIN: Plosphorylated, probably by CDC2. The degree of phosphorylation varies throughout the cell cycle, and is highest at the G2/M transition. Becomes hyperphosphorylated in response to all differentiation and interaction with HES1 or RUNXI. SIMILARITY: Contains 6 WD repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (POTENTIAL). (POTENTIAL). (POTENTIAL).
                           decreases the affinity for nuclear components.
TISSUE SPECIFICITY: In all tissues examined, mostly in brain,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (POTENTIAL)

The degree of phosphorylation varies throughout the cell cycle, and is highest at the G2/M transition. Becomes hyperphosphorylated in response to all differentiation and interaction with HES1 or RUNXI. SIMILARITY: Contains 6 WD repeats. SIMILARITY: Belongs to the WD-repeat Groucho/TLE family.
                                                                                                                                        M., Clevers H.;

Hyperphosphorylation decreases the affinity for nuclear components. Isoform 7 and isoform 8 are nuclear and cytoplasmic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           VSP 006991;

Clathrin coat assembly protein AP180 (Clathrin coat associated protein
AP180) (91 kDa synaptosomal-associated protein) (Phosphoprotein Fl-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         PUNCTION: Adapting are components of the adaptor complexes which link clathrin to receptors in coated vesicles. Clathrin-associated protein complexes are believed to interact with the cytoplasmic tails of membrane proteins, leading to their selection and concentration. Binding of AP180 to clathrin triskelia induces their assembly into 60-70 nM coates.

SUBCELLULAR LOCATION: Component of the coat surrounding the cytoplasmic face of coated vesicles in the plasma membrane.

TISSUE SPECIFICITY: Brain. Associated with the synapses.
DEVBLOPMENTAL STAGE: Developmentally regulated in a pattern coincident with active synaptogenesis and synaptic maturation.
DOMAIN: Possesses a three domain structure: the N-terminal 300 residues harbor a clathrin binding site, an acidic middle domain terminal domain interrupted by an Ala-rich segment, and the C-terminal domain (166 residues).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SIMILARITY: Contains 1 epsin N-terminal homology (ENTH) domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Eukaryota, Metazoa, Chordata, Craniata, Vertebrata, Euteleostomi,

-!- FUNCTION: Adaptins are components of the adaptor complexes which link clathrin to receptors in coated vesicles. Clathrin-associated protein complexes are believed to interact with the cytoplasmic tails of membrane proteins, leading to their selection and concentration. Binding of AD180 to clathrin triskelia induces their assembly into 60-70 nM coats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   01-NOV-1997 (Rel. 35, Created)

EMBO J. 10:2259-2266 (1991).
-!- FUNCTION: REQUIRED FOR SURVIVAL AND DIFFERENTIATION OF FEMALE GERM
LINE CELLS. PLAYS A ROLE IN GERM LINE SEX DETERMINATION.
-!- SUBCELLULAR LOCATION: NUCLear (Potential).
-!- DEVELOPMENTAL STAGE: FIRST APPEARS IN THE GERMARIUM AND
ACCUMULARES IN WIRES CELLS DURING OGGENESIS. STORED IN THE EGG,
BUT IS RAPIDLY LOST IN THE EMBRYOS EXCEPT FOR ITS CONTINUED
PRESENCE IN THE GERM LINE PRECURSOR POLE CELLS.
-!- SIMILARITY: CONTAINS 4 C2H2-type zinc fingers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      TRANSFAC; T00669; ...

SUBUNIT: Heterotrimer composed of a catalytic subunit and an homodimer of accessory subunits.
SUBCELLULAR LOCATION: Mitochondrial.
DISEASE: Defects in POLG are a cause of autosomal dominant progressive external ophthalmoplegia with mitochondrial DNA deletions (PEO) [MTM:157640]; also known as mitochondrial DNA breakage syndrome. Patients with PEO have mitochondrial myopathy, progressive external ophthalmoplegia, and other abnormalities associated with multiple different deletions of mitochondrial DNA.
SIMILARITY: Belongs to the DNA polymerase type-A family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 MEDLINE=2134738; PubMed=114,11666;

THE CHANNEL ACTIVITY IS DIRECTED BY THE PORE-FORMING AND VOLTAGE-SENGITIVE ALPHA-1 SUBUNIT. IN MANY CASES, THIS SUBUNIT IS SUFFICIENT TO GENERATE VOLTAGE-SENSITIVE CALCIUM CHANNEL ACTIVITY. THE AUXILIARE SUBUNITS BETA AND ALPHA-2/DELTALINNED BY A DISULPIDE BRIDGE REGULATE THE CHANNEL ACTIVITY (BY
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Schwarz T.L.;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SUBCELLULAR LOCATION: Integral membrane protein.

TISSUE SPECIFICITY: Expression is higher in the forebrain than in the electric lobe.

DOMAIN: Each of the four internal repeats contains five hydrophobic transmembrane segments ($1, $2, $3, $5, $6) and one positively charged transmembrane segment ($4). $4 segments probably represent the voltage-sensor and are characterized by a series of positively charged amino acids at every third position. SIMILARITY: Belongs to the calcium channel alpha-1 subunits
                                                                                                                                                                                                                                                                                                   Bukaryota, Metazoa, Chordata, Craniata, Vertebrata, Chondrichthyes,
